

An Internship Report
Of
Google AI-ML Virtual Internship

Submitted

To

School of Computer Science and Engineering
IILM University, Greater Noida, U.P.

In partial fulfilment of the requirement of degree of

B.Tech (Computer Science and Engineering)

By

Roll Number of Student:

25SCS1003001428

Name of Student: AKSHAT RAJ

Batch: 2025-2029

CANDIDATE'S DECLARATION

I, AKSHAT RAJ, do hereby declare that the internship report titled “Frontend Developer Virtual Internship” has been completed by me to fulfil the requirement for the award of the degree of Bachelor of Technology in Computer Science and Engineering. All the references have been quoted and I have not taken as such any material from any other source. I affirm that this report is my own and has not been submitted to any other institute for any degree/diploma requirement, and further I shall be solely responsible for any kind of copyright violation in this regard.

Signature:-

Student Name: AKSHAT RAJ

Roll No.: 25SCS1003001428

ACKNOWLEDGEMENT

I am using this opportunity to express my gratitude to everyone who supported me throughout the Internship Program. I am thankful for their aspiring guidance, invaluable constructive criticism and friendly advice during this work. I am sincerely grateful to them for sharing their truthful and illuminating views on a number of issues related to this work.

I would like to thank the Host Dhanraj team, for providing me the opportunity and the structured platform to learn and gain hands-on exposure in the domain of Frontend Developer. I am also thankful to my institute, IILM University, Greater Noida, and the faculty of the School of Computer Science and Engineering for their continuous support and encouragement.

I express my gratitude to my parents for their blessings.

Signature:-

Student Name: AKSHAT RAJ

Roll No.: 25SCS1003001428

TABLE OF CONTENTS

1. Candidate's Declaration	i
2. Acknowledgement	ii
3. Internship Completion Certificate	-
4. Project Description	1
4.1 Introduction	1
4.2 Organization Profile	2
4.3 Problem Statement	3
4.4 Project Objectives	3
4.5 Scope of the Project	4
4.6 Technologies and Tools Used.....	4
4.7 System Architecture	5
4.8 Methodology	6
4.9 Expected Outcomes.....	7
4.10 Certificates of Completion and Communication Proof	8
5. Bibliography/References	9

3. INTERNSHIP COMPLETION CERTIFICATE

4. PROJECT DESCRIPTION

1. ABSTRACT

AI Buddies is a modern web-based presentation platform for an AI Automation Agency. The project is designed to communicate how businesses can use artificial intelligence and workflow automation to improve customer interaction, lead handling and operational efficiency. The website combines a premium visual interface with interactive 3D graphics, smooth scrolling and motion effects to create an engaging digital experience.

The application is developed using Next.js and TypeScript with Tailwind CSS for responsive styling. Three.js and React Three Fiber are used for interactive 3D visual elements, while Framer Motion and GSAP support interface animation. The website contains service sections, industry solutions, integrations, case studies, testimonials, FAQs and contact/lead-generation functionality.

The project demonstrates how a frontend application can be structured into reusable components and centralized content so that the site remains scalable, maintainable and suitable for deployment.

2. INTRODUCTION

Artificial Intelligence and automation are increasingly being used by organizations to reduce repetitive work and improve customer experiences. However, businesses often need a clear digital platform through which automation services can be explained, demonstrated and converted into enquiries.

AI Buddies addresses this requirement through a dedicated agency website. Instead of functioning as a traditional static business page, the application uses animation, interactive graphics and structured service information to communicate AI automation capabilities in a visually compelling manner.

The project focuses primarily on frontend engineering, user experience, responsive design, interactive graphics and lead-generation presentation. Its architecture also leaves room for integration with backend automation systems and external services.

3. PROBLEM STATEMENT

Many business websites fail to communicate complex AI and automation services in a simple and engaging way. A conventional website may provide text about services but does not necessarily demonstrate the value of automation or guide visitors toward taking action.

The problem addressed by this project is therefore to create a responsive, modern and interactive website that can present AI automation services clearly, build trust through case studies and testimonials, and provide a direct route for potential clients to initiate contact.

4. OBJECTIVES

- Develop a professional website for an AI automation agency.
- Present AI-powered services in a clear and understandable format.
- Create a responsive interface for desktop, tablet and mobile screens.
- Use interactive 3D graphics and motion design to improve engagement.
- Implement reusable React/Next.js components for maintainability.
- Provide case studies, testimonials and FAQs to support user decision-making.
- Provide contact and WhatsApp-oriented lead-generation functionality.

5. PROPOSED SOLUTION

The proposed solution is a single-page, component-driven web application built around a strong visual hierarchy. Visitors are introduced to the agency through an animated hero section, followed by service offerings, benefits, workflows, industry solutions, integrations, proof of results, FAQs and contact actions.

The frontend separates reusable presentation components from centralized content/configuration. This allows service names, descriptions, statistics and other marketing information to be changed without rewriting the overall interface. The design is optimized around clear calls-to-action and responsive layouts.

6. TECHNOLOGY STACK

Technology	Purpose
@react-three/fiber	React integration for Three.js scenes
framer-motion	Component and layout animations
gsap	Advanced timeline-based animation
lenis	Smooth scrolling experience
lucide-react	Interface icons
next	Application framework, routing and optimized React rendering
react	Component-based UI development
three	3D graphics and rendering
tailwindcss	Utility-first responsive styling
typescript	Static typing and safer application development

The project also includes configuration suitable for modern deployment workflows such as Vercel. Workflow automation concepts and integrations are presented as part of the agency's service offering.

7. SYSTEM REQUIREMENTS

Hardware Requirements

- Modern dual-core or better processor.
- Minimum 4 GB RAM; 8 GB or more recommended for development.
- At least 2 GB free storage for project dependencies and build files.
- Display capable of handling modern web graphics.

- Windows, macOS or Linux.
- Node.js and npm-compatible package manager.
- Modern browser such as Chrome, Edge, Firefox or Safari.
- Code editor such as Visual Studio Code.
- Internet connection for installing dependencies and using external integrations.

8. SYSTEM ARCHITECTURE

The application follows a layered frontend architecture. The Next.js application provides the runtime and page structure. React components are responsible for reusable interface sections, while Tailwind CSS controls visual layout and responsiveness. Animation libraries handle motion and interaction, and Three.js/React Three Fiber provides the 3D scene. Centralized configuration/content files provide structured marketing data.

- **Presentation Layer:** navigation, hero, service cards, case studies, testimonials, FAQ and footer.
- **Interaction Layer:** cursor effects, scrolling, motion transitions, hover states and interactive elements.
- **3D Layer:** Three.js / React Three Fiber based visual experience.
- **Content Layer:** centralized service, branding and marketing content.
- **Integration Layer:** contact/WhatsApp actions and future automation/backend connections.

9. MAJOR MODULES

9.1 Navigation Module

Provides site navigation and access to key sections with a responsive mobile experience.

9.2 Hero Module

Introduces AI Buddies with prominent messaging, calls-to-action and interactive visual elements.

9.3 AI Automation Services

Presents core services such as AI chatbots, WhatsApp automation, AI voice agents, lead qualification and customer support.

9.4 Interactive 3D Experience

Uses Three.js and React Three Fiber to create an immersive visual element that reinforces the futuristic AI theme.

9.5 Industry Solutions

Explains how automation can be applied to different business contexts.

9.6 Integrations

Communicates compatibility with workflow and business tools used in automation ecosystems.

9.7 Process / Workflow

Explains how a potential client can move from enquiry to automation implementation.

9.8 Case Studies

Provides examples of business outcomes and service applications to establish credibility.

9.9 Testimonials

Displays customer-style feedback and social proof.

9.10 FAQ

Answers common questions through an interactive expandable interface.

9.11 Contact / Lead Generation

Provides direct conversion paths, including WhatsApp-oriented contact functionality.

9.12 Footer

Provides secondary navigation, branding and supporting information.

10. KEY FEATURES

- Modern futuristic visual design focused on AI and automation.
- Responsive layouts across common screen sizes.
- Interactive 3D graphical experience.
- Smooth scrolling and animated transitions.
- Reusable React components.
- Centralized content/configuration for easier updates.
- Service, industry and integration showcases.
- Case studies and testimonials for credibility.
- Interactive FAQ section.
- Direct contact and WhatsApp lead-generation flow.
- Production-oriented Next.js project structure.

11. IMPLEMENTATION DETAILS

The application is implemented as a Next.js project using TypeScript and React. The interface is divided into logical sections and reusable components rather than placing all functionality in a single page component. This improves readability and enables individual sections to be modified independently.

Tailwind CSS is used for responsive layout, spacing, typography and visual styling. Animation libraries are combined where appropriate: Framer Motion is suitable for component-level transitions, GSAP supports more complex animation timelines, and Lenis contributes to smooth scrolling. Three.js and React Three Fiber are used for the interactive graphical scene.

The project configuration and package dependencies indicate a modern frontend toolchain. The structure supports local development, production builds and deployment to a cloud platform such as Vercel.

12. UI/UX AND ANIMATION

The UI/UX strategy emphasizes visual hierarchy, strong contrast, concise content blocks and clear calls-to-action. Glass-like panels, futuristic typography and animated transitions support the agency's technology-focused identity.

- Responsive design ensures usability on mobile and desktop.
- Motion is used to guide attention instead of replacing essential information.
- Interactive hover and scroll states provide feedback to users.
- 3D visuals create a strong visual identity for the AI theme.
- Service cards and structured sections make complex offerings easier to scan.
- FAQ and contact sections reduce friction before conversion.

13. TESTING AND QUALITY ASSURANCE

Testing for this project focuses on functional behavior, responsive layout, visual consistency and build reliability.

Test Area	Expected Result
Navigation	Users can move to major sections without layout issues.
Responsive Layout	Content remains usable across mobile, tablet and desktop widths.
Animations	Transitions render smoothly without blocking core content.
3D Scene	Interactive visual loads and remains contained within the intended section.
FAQ	Questions expand/collapse correctly.
Contact Actions	Contact/WhatsApp actions lead users to the intended communication flow.
Build	Project can be installed and built using the configured Next.js toolchain.

14. ADVANTAGES

- Provides a professional digital identity for an AI automation business.
- Explains technical services in a client-friendly presentation.
- Highly visual design can increase engagement and memorability.
- Reusable architecture simplifies future development.
- Responsive interface supports users on different devices.
- Case studies and testimonials help communicate credibility.
